The statute of limitations has surely expired for Contact, the 1997 Robert Zemeckis adaptation of Carl Sagan’s eponymous novel. The film suggests early on that Earth has been receiving communications from outer space, but for most of its two and a half hours keeps its audience in suspense as to the nature of the extraterrestrials sending them. When Jodie Foster’s astronomer protagonist finally gets some one-on-one time with an alien, it takes the form of her own long-dead father, who inspired her choice of career. This ending quickly became fodder for South Park jokes, but time seems to have vindicated it; any look back at the CGI aliens in other movies of the mid-nineteen-nineties confirms that the right choice was made. Contact was not a straightforward book-to-film adaptation. Rather, Sagan and his wife Ann Druyan intended the project as a film first, and even wrote a detailed script treatment before publishing the story as a novel. About three decades earlier, 2001: A Space Odyssey had emerged out of a similarly unconventional process. Rather than adapting an existing book, as he’d done before with Lolita and Dr. Strangelove, Stanley Kubrick and Arthur C. Clarke decided to work together on the ideas that would shape both a film directed by the former and a novel written by the latter. The collaboration had its difficulties, not least when it came time to bring their vision of mankind’s future to a satisfying close. Enter Sagan, already on his way to becoming a well-known thinker about the universe and man’s place within it. “My friend Arthur C. Clarke had a problem,” he remembers in his book The Cosmic Connection. “He was writing a major motion picture with Stanley Kubrick” (then called Journey Beyond the Stars) on which “a small crisis in the story development had arisen.” In the film a spacecraft’s crew “was to make contact with extraterrestrials. Yes, but how to portray the extraterrestrials?” Kubrick had ideas about going the traditional route, creating aliens “not profoundly different from human beings” and thus portrayable by humans in suits, much like the apes at the monolith Sagan opposed this, as “the number of individually unlikely events in the evolutionary history of Man was so great that nothing like us is ever likely to evolve again anywhere else in the universe. I suggested that any explicit representation of an advanced extraterrestrial being was bound to have at least an element of falseness about it, and that the best solution would be to suggest, rather than explicitly to display, the extraterrestrials.” Kubrick ultimately did choose that artistic path, resulting in such haunting, alien-free scenes as the ending wherein David Bowman encounters his aged self in an eighteenth-century bedroom. Whether or not that was quite what he had in mind, Sagan did credit Kubrick’s 2001 with “expanding the average person’s awareness of the cosmic perspective” — which was more than he could say a decade later about Star Wars. Clarke (1917-2008) are sometimes considered to be the ‘fathers’ of Science Fiction writing, although other writers such as Robert Heinlein (1907-1988) are also often included; these three are known as ‘The Big Three’ in Science Fiction. Screenshot from “I, Robot” official movie trailer on Youtube. Asimov’s ‘Foundation’ and ‘Robot’ (later known as ‘I, Robot’), and Clarke’s ‘2001: A Space Odyssey’, the latter two made into modern blockbuster movies, continue to amaze us. Arthur C. Clarke on the movie set of “2001: A Space Odyssey”. But did you know that Asimov and Clarke made a treaty – that, if asked, each would claim to be the second-best Science Fiction writer? Clarke’s acknowledgement in his ‘Report on Planet Three’ book reads: “In accordance with the terms of the Clarke-Asimov treaty, the second-best science writer dedicates this book to the second-best science-fiction writer.” What do you think? Do you have a favourite Science Fiction story or writer? What makes good, or bad, Science Fiction? Should we even celebrate Science Fiction Day? How will you be celebrating it? Currently, there are an estimated 6 million people living with hepatitis in the United States, and more than 50,000 people are diagnosed with this disease every year. There are three primary types of hepatitis, and while their symptoms can be similar, they vary largely in the ways they’re transmitted. Learning more about each type of hepatitis can help you better understand the condition as a whole.Hepatitis A is the most easily transmitted of the three viruses. It affects approximately 2,500 people every year in the United States. It typically spreads through feces-contaminated food or water and is found in the feces of people who have the virus. Hepatitis A causes a short-term, acute sickness that most people heal from without treatment. However, it can cause serious illness in some people. This virus is more common in places with underdeveloped sanitation systems. While doctors can’t treat hepatitis A with medication, people who get this virus can manage its symptoms with fluids, rest and good nutrition. There’s also a safe and effective vaccine available to protect you against hepatitis A.What Is Hepatitis B?Hepatitis B can occur both acutely (meaning it develops quickly and lasts a short time) and chronically (meaning it develops slowly over time and worsens over months or years). According to the Centers for Disease Control and Prevention, up to 2 million people in the United States are chronically affected with hepatitis B. Hepatitis B can be transmitted through sexual activity and exposure to infected blood. It can also be passed from a parent to their newborn child during birth. Hepatitis B usually causes short-term discomfort that many people recover from completely after about four to eight weeks. However, it can turn into a chronic condition that lasts for years; this is more likely in older adults. Doctors can treat severe chronic hepatitis B with antiviral medications. However, in most cases, treatments focus on proper hydration and nutrition. There’s a safe vaccine available to protect you against hepatitis B, too.What Is Hepatitis C?Photo Courtesy: BSIP/Getty Images Approximately 4 million people in the United States are affected with hepatitis C. This form of hepatitis causes a chronic illness in over 50% of people who get this type of the virus. It’s the least transmissible of the three viruses and can spread through contact with infected blood. Hepatitis C occurs more commonly in people who engage in intravenous drug use. If you received a blood transfusion before 1992, you should also get tested for hepatitis C if you haven’t previously. Hepatitis C can spread through unprotected sexual intercourse, but this is a less common way to transmit it. While there’s no vaccine for chronic hepatitis C, treatments that are available today offer a 95% cure rate.Chronic hepatitis C can significantly affect how your liver works. It can cause cirrhosis, which means that your normal liver tissue is replaced with scar tissue. It can also cause liver cancer. However, there are medications that can help keep this disease in check. Making lifestyle changes, such as reducing or eliminating alcohol from your diet, can also decrease your chances of experiencing complications. In severe cases, hepatitis C may require a liver transplant. The varying forms of viral hepatitis affect millions of people in the United States. Chronic hepatitis often has few symptoms in its early stages, so recognizing the associated dangers and getting tested if you’ve been exposed may save your life. Although there are five types of viral hepatitis, only A, B and C are the forms commonly found in the United States.Resource Links:“Hepatitis A, B, and C: Learn the Differences,” Immunization Action Coalition“What’s the Difference Between Hepatitis A, B and C?,” UNC Health Talk“The ABCs of Hepatitis,” Centers for Disease Control and Prevention“What’s the Difference: Hepatitis B vs Hepatitis C?,” Hepatitis B Foundation MORE FROM SYMPTOMFIND.COM
